

A JOB PLATFORM FOR HEALTH AND STEM CAREERS

A two-sided hiring marketplace for US healthcare and STEM roles — candidate profiles, resume tooling, employer job posting and moderated listings — designed and engineered end to end by Edion Web Technologies.

CLIENT

Bxience, Chicago

SCOPE

Product design, web app, SEO

STACK

React · Node · MySQL

GENERAL JOB BOARDS ARE THE WRONG TOOL FOR CLINICAL HIRING

Bxience is a Chicago-based job platform for healthcare and STEM professionals in the United States, serving recent graduates, international students and experienced practitioners alongside the organisations hiring them. The founders came from US staffing and knew what the large boards get wrong for this market.

THE PROBLEM

- Generalist boards bury clinical and lab roles under unrelated listings.
- Licences, certifications and visa status decide fit, and no board captures them.
- Graduates and international students don't know which titles to search for.
- Employers get volume, not qualified applicants.

WHAT IT DEMANDED

- A candidate profile built around credentials, not job history alone.
- Search filters that speak the industry's language.
- A self-serve employer side with review before listings go live.
- Two audiences, one product, without either feeling like an afterthought.

The brief was a specialist marketplace: narrow enough that every listing is relevant, complete enough that a candidate never has to leave to finish an application.

WHAT WE SET OUT TO BUILD

SEARCH THAT UNDERSTANDS THE FIELD

Keyword and location entry on the front door, with filters for discipline, job type, seniority and remote work behind it.

ONE PROFILE, MANY APPLICATIONS

Upload an existing resume or build one on the platform, then apply without re-entering anything.

EMPLOYERS SELF-SERVE

Company accounts post roles, manage listings and review applicants without an account manager.

QUALITY HELD AT THE GATE

Every job posting is reviewed before publication, keeping the board free of the spam that plagues open listings.

SCOPE OF WORK

PRODUCT DESIGN	Information architecture for both audiences, search and results design, profile and resume builder, employer console, responsive UI system.
ENGINEERING	React front end, Node API, MySQL schema for users, companies, listings and applications; authentication, file handling and email.
MODERATION	Admin queue for job approvals, employer verification, listing expiry and content controls.
GROWTH	Indexable job and category pages, structured data for job postings, FAQ content and analytics.

APPROACH

We designed the candidate journey first — search, read, apply, track — and treated the employer console as the supply that has to keep it stocked. Moderation sits between them, so growth never comes at the cost of listing quality.

ONE SEARCH BAR, NOTHING IN ITS WAY

The landing page holds a headline, a subhead and a two-field search — keywords and location — over a pale molecular pattern that signals the sector without decorating it. Indigo carries the brand and the navigation; coral is reserved for the single action that starts the journey.

PALETTE

Indigo

Action coral

Ink

Pattern mint

PRINCIPLES

- Coral appears once per screen, on the step forward.
- Listings read as documents, not adverts.
- Candidate and employer share one component set, two navigations.

FROM SEARCH TO APPLIED, WITHOUT LEAVING

The candidate side is one continuous account rather than a series of hand-offs. The work a job seeker does once — credentials, experience, a resume — is carried into every application, and the platform keeps the record of where each one stands.

01 Search	02 Filter	03 Profile	04 Apply	05 Track
Keywords and location, or a popular search.	Discipline, job type, seniority, remote.	Education, experience, skills, certifications.	One resume, one click, per listing.	Status of every application in one place.

RESUME BUILDER

Candidates upload an existing resume or build one on the platform, section by section. Either way the result becomes the profile employers see and the document attached to every application.

ALERTS & TRACKING

Saved searches send new matches by email; My Applications keeps the status of every submission in one list, so candidates stop maintaining their own spreadsheet.

WHY IT MATTERS

A nurse comparing three hospital roles and a graduate applying to twenty lab positions need the same thing: no repeated data entry, and a reliable answer to "where did that application go?"

SUPPLY SIDE, REVIEWED BEFORE IT GOES LIVE

Employers create a company account, complete a posting form and submit it for approval; publication follows review rather than payment. The delay is deliberate — it is what keeps the board worth searching, and it is stated plainly to employers as one to five business days.

01**Company account**

Organisation profile
candidates can browse
from Find Company.

02**Post a role**

Structured form: title,
discipline, type,
location, requirements.

03**Admin review**

Moderation queue
approves, returns or
rejects each listing.

04**Live & indexed**

Published, searchable
and eligible for job-
posting rich results.

APPLICANT MANAGEMENT

- Applications collected per listing with the candidate's profile attached.
- Resume viewable inline, no downloads required to triage.
- Status changes flow back to the candidate's tracker.

ADMIN CONTROLS

- Employer verification before the first listing publishes.
- Listing expiry and renewal, so the board never shows dead roles.
- Category and taxonomy management as the sector coverage grows.

REACT, NODE AND MYSQL

A React front end against a Node API, with MySQL holding users, companies, listings and applications. Categories, disciplines and job types are data, so the taxonomy grows with the market rather than with releases.

APPLICATION

- React SPA with shared component library
- Node REST API, token-based authentication
- Role separation: candidate, employer, admin
- Resume upload, storage and inline rendering

DATA MODEL

- Users, profiles, credentials and resumes
- Companies and verification state
- Listings, taxonomy and approval status
- Applications, statuses and saved searches

ENGINEERING DECISIONS

Filters as data	Search facets are driven by the taxonomy tables, so adding a discipline is an admin action, not a code change.
Approval as state	A listing's status governs every read path at once — public search, company page, sitemap and structured data.
Crawlable job pages	Individual listings render at stable, indexable URLs with JobPosting structured data rather than living only inside app state.
One resume, many uses	Uploaded and built resumes resolve to the same stored record, so applications, profiles and employer views never diverge.

FOUND BY THE PEOPLE THE JOBS ARE FOR

Job seekers search in Google before they search on any platform. The site is built so that each listing and each category can answer one of those queries directly.

CATEGORY PAGES

Healthcare, STEM and role families such as hospital administration each get an indexable page with live listings.

STRUCTURED JOB DATA

JobPosting markup on every approved listing makes roles eligible for job search results.

COMPANY PAGES

Find Company gives every employer a profile that ranks for its own name and collects its open roles.

ANSWERS ON PAGE

An FAQ covering sign-up, profiles, application tracking and posting rules, marked up for rich results.

OUTCOME

Bxience runs as a working two-sided platform. Candidates search, build a resume, apply and follow their applications in one account; employers post, get reviewed and manage applicants without an intermediary; the admin team controls what reaches the board. The taxonomy, the moderation flow and the indexing are built to carry more disciplines and more employers without a rebuild.
