

A BOOKING ENGINE BUILT FOR JORDAN'S RENTAL MARKET

A custom multi-step reservation platform, fleet management system and SEO foundation for Dunya Car Rental — designed and engineered end to end by Edion Web Technologies.

CLIENT

Dunya Car Rental, Jordan

SCOPE

Web platform, booking engine, SEO

STACK

Laravel · MySQL

A THIRTY-YEAR RENTAL OPERATOR WITHOUT A DIRECT SALES CHANNEL

Dunya Car Rental has served Jordan since 1995, operating its own fleet across Amman, Aqaba and Queen Alia International Airport for tourists, business travellers and residents. The company owns and maintains every vehicle it rents, but its bookings arrived through phone calls, walk-ins and third-party aggregators that took a cut of every reservation.

THE PROBLEM

- No way to check availability, price a rental or confirm a car online.
- Rates, insurance packages and extras lived in spreadsheets and staff memory.
- Aggregators owned the customer relationship and the margin.
- Airport travellers comparing options found competitors first.

WHAT IT DEMANDED

- Real-time fleet availability tied to pickup and return windows.
- Transparent, itemised pricing with no surprises at the counter.
- Insurance tiers a traveller can compare in seconds.
- An admin layer the Dunya team can run without a developer.

The brief to Edion was direct: build the channel Dunya never had, and make it good enough that travellers stop shopping around.

WHAT WE SET OUT TO BUILD

OWN THE BOOKING

Move reservations off aggregators and onto Dunya's own site, with the customer record staying in-house.

SERVE THE AIRPORT TRAVELLER

Location-aware search built around AMM, Aqaba and city branches, with flight details captured at checkout.

PRICE IN THE OPEN

Show the daily rate, the coverage tier and every extra before the traveller commits.

BE FOUND FIRST

Rank for the high-intent rental searches that currently send traffic to global platforms.

SCOPE OF WORK

PRODUCT DESIGN	Information architecture, booking flow design, responsive UI system, fleet and coverage layouts.
ENGINEERING	Laravel application, MySQL schema for fleet, rates, coverage and reservations, five-step booking engine, payment and voucher handling.
ADMIN TOOLING	Vehicle, rate, location and package management; booking modification, cancellation and claims workflows.
GROWTH	Technical SEO, location and category landing pages, blog architecture, structured data and analytics.

APPROACH

We modelled the rental business first — vehicles, rate tables, coverage tiers, locations and seasonality — then designed the interface around that model, so the site never promises a price the operation cannot honour.

A CONFIDENT INTERFACE, QUIET WHERE IT COUNTS

The landing page leads with Jordan itself — Petra, Wadi Rum, the desert highway — and drops the search panel directly over it. Everything past the hero turns down the volume: white surfaces, black type, and a single red reserved for the action the traveller is meant to take next.

PALETTE

Action red

Ink

Summary sand

Surface

PRINCIPLES

- One primary action per screen, always in red.
- Price visible at every step, never recalculated silently.
- Cards over dense tables on mobile; tables where comparison matters.

FIVE STEPS, ONE RUNNING TOTAL

The reservation is a single stateful journey. A persistent summary rail carries the vehicle, the dates, the coverage and the total from the first search to the confirmation, so the number a traveller sees at step two is the number they pay at step five.

01 Search

Pickup, return, dates and rental type.

02 Car listing

Filter by class, transmission and price.

03 Coverage

Compare tiers, add equipment.

04 Payment

Driver details, flight number, card.

05 Confirmed

Voucher issued, booking manageable.

DETAILS THAT DO THE WORK

- Vehicle cards state insurance, transmission, drivetrain, passengers and bags before the click.
- Daily rate and full-period total shown side by side.
- Optional flight number lets the team meet delayed arrivals.
- Terms linked from every card, not buried at checkout.

COVERAGE YOU CAN COMPARE, EXTRAS YOU CAN PRICE

Coverage			
Coverage	Standard Package	Premium Package	Super Package
Unlimited Kilometers	✓	✓	✓
Second Additional Driver	✓	✓	✓
Airport Surcharge	✓	✓	✓
Roadside Assistance	✓	✓	✓
Collision Damage Waiver (CDW)	✓	✓	✓
Third Party Insurance (TPI)	✓	✓	✓

Standard, Premium and Super packages sit in one matrix: fourteen coverage lines, three columns, a tick or a cross in every cell. Equipment — child seats by weight class, GPS, WiFi, an additional driver — is added by counter or toggle, and each change updates the running total immediately.

COST CALCULATOR

A standalone estimator lets travellers model a rental — package, locations, days, rate and extras — before entering the booking flow at all. It doubles as a landing page for budget-driven search.

MANAGE BOOKING

Customers view, modify or cancel a reservation, file a claim and request coverage compensation without calling the branch.

BUILT ON LARAVEL AND MYSQL

The platform is a single Laravel application backed by MySQL. Rates, coverage tiers, extras and locations are all data, not code, so the Dunya team changes seasonal pricing or adds a vehicle without a deployment.

APPLICATION

- Laravel MVC with a dedicated pricing service
- Session-backed multi-step reservation state
- Blade templating with a shared component layer
- Role-based admin authentication

DATA MODEL

- Vehicles, classes and availability windows
- Rate tables by location, duration and season
- Coverage packages and per-line entitlements
- Reservations, extras, vouchers and claims

ENGINEERING DECISIONS

Pricing in one place	Every surface — calculator, listing, coverage, checkout — calls the same pricing service, so no two screens can disagree.
Currency and language	EN/USD switching is built into the layer above content, ready for additional locales as Dunya expands.
Server-rendered by default	Pages ship as HTML for crawlability and first-load speed; interactivity is layered on where it earns its weight.
Operational safeguards	Deposit rules, minimum rental periods, driver-age checks and licence requirements are enforced in the booking logic, not left to the counter.

WINNING THE SEARCH BEFORE THE BOOKING

Rental demand in Jordan is captured at the query. The site is structured so that each way a traveller phrases the search has a page built to answer it.

LOCATION PAGES

Amman, Aqaba and Queen Alia International Airport each get a dedicated, indexable page with local context and a live search panel.

CATEGORY PAGES

Economy, sedan, SUV, luxury and chauffeur services map to how travellers actually shop.

ANSWERS ON PAGE

Deposit, licence, minimum age, fuel and mileage questions answered in an FAQ block with structured data.

EDITORIAL

A blog covering Jordan road trips and driving guidance builds topical depth around the commercial pages.

OUTCOME

Dunya now sells directly. A traveller lands from search, prices a rental with every fee visible, chooses coverage, books and manages the reservation without speaking to anyone — and the booking, the customer and the margin stay with Dunya. The team runs fleet, rates and packages from the admin, and the platform is built to take on new locations and languages as the business grows.
