

TEST SERIES, NOTES AND TUTORS ON ONE PLATFORM

A four-sided education platform for TutorWale, Delhi — subscription test-series packages, a notes and books store, course and instructor listings, and a tuition-requirement marketplace — designed and engineered end to end by Edion Web Technologies.

A TUITION BUSINESS RUNNING ON PHONE CALLS AND WHATSAPP

TutorWale is a Delhi-based education provider serving school students from nursery through Class 12, plus competitive-exam candidates. It sells three different things — practice test series, printed and digital study material, and access to tutors — to two different audiences, students and the teachers who want the work.

THE PROBLEM

- Test series and notes were distributed manually, per enquiry.
- Tutor matching happened over calls, with no record of who was told what.
- No way for a parent to post a requirement and be found by teachers.
- Pricing across classes, subjects and durations lived in the team's heads.

WHAT IT DEMANDED

- Subscription packages priced by duration, purchasable online.
- A real storefront for notes and books, filterable by class.
- A requirement board where parents post and verified tutors respond.
- One admin controlling catalogue, pricing, approvals and leads.

Four products, two audiences, one site — the design problem was making that legible from a single navigation bar.

WHAT WE SET OUT TO BUILD

SELL PRACTICE, NOT PROMISES

Test-series packages with the question count, the inclusions and every duration option visible before purchase.

A STORE THAT SCALES

Hundreds of notes and textbooks, filtered by class from Nursery upward, priced individually.

MATCH TUTORS TO DEMAND

Parents post a requirement free; verified teachers browse and respond, online or in person.

PROTECT BOTH SIDES

Contact details masked until a lead is shared, and every requirement approved before it appears.

SCOPE OF WORK

PRODUCT DESIGN	Information architecture across four product lines, package and store layouts, requirement board, instructor profiles, responsive UI system.
ENGINEERING	Laravel application, MySQL schema for classes, subjects, packages, products, requirements and users; multi-role registration, checkout and subscription access.
ASSESSMENT	Test-series delivery: MCQ banks, previous-year papers, timed attempts and results tied to a student's active packages.
ADMIN & GROWTH	Approval queues, lead distribution, catalogue and price management; indexable class and subject pages, blog and analytics.

APPROACH

We modelled class, subject and board once, then hung every product line off that spine — a package, a set of notes and a tuition requirement all describe the same student in the same terms, which is what lets one search reach all three.

BRIGHT ENOUGH FOR STUDENTS, CLEAR ENOUGH FOR PARENTS

Indigo carries structure — navigation, links, primary buttons — and a single orange marks the one action the visitor is being asked to take. The homepage offers four entry points at once (enrol, free trial, register, callback) because the audience arrives at very different stages of certainty.

PALETTE

Indigo

Action orange

Panel tint

PRINCIPLES

- One orange action per screen; everything else is indigo or plain.
- Filters live in a left rail on every catalogue, identical across store and packages.
- Prices always shown in rupees with the duration they buy.

PRICED BY DURATION, FILTERED BY CLASS

A test-series package states its subject, its question count and every duration a student can buy — one month, three, six, twelve — on the card itself, so the decision is made before checkout. The store runs on the same filter rail, with over two hundred titles indexed by class.

TEST SERIES

MCQ banks and previous-year papers, attempted online and scored on submission.

E-STORE

Notes and textbooks per class, with search, sorting and per-item pricing.

COURSES

Instructor-led programmes listed alongside the tutors who teach them.

REQUIREMENTS IN, VERIFIED TUTORS OUT

Parents post a tuition requirement for free: class, subjects, online or home, budget range and preferred time. Teachers browse the board filtered by city, class, mode, fee and gender preference. Names stay masked and contact details are withheld until the lead is shared, so neither side is exposed before there is intent.

01 Post

Parent submits the requirement, free of charge.

02 Approve

Admin reviews it before it reaches the board.

03 Share lead

Matching tutors receive it, with view counts tracked.

04 Connect

Details unmask and the demo lesson is arranged.

WHY MASKING

An open board of parents' phone numbers would be harvested within a week. Masking names and withholding contact until the lead is shared keeps the supply of requirements worth having.

BUILT ON LARAVEL AND MYSQL

One Laravel application backed by MySQL serves all four product lines and three account types. Classes, subjects, package durations and store categories are data, so the team extends the catalogue without a release.

APPLICATION

- Laravel MVC with Blade component layer
- Role-based registration: student, instructor, store
- Cart, checkout and subscription entitlement
- Timed test engine tied to active packages

DATA MODEL

- Classes, subjects and boards as a shared spine
- Packages, durations and price tiers
- Products, categories and orders
- Requirements, approvals, lead shares and views

ENGINEERING DECISIONS

One taxonomy, four catalogues	Class and subject are defined once and reused by packages, products, courses and requirements, so filters behave identically everywhere.
Duration as a price tier	A package holds many duration-price rows rather than many packages, which is why one card can show a full range without cloning content.
Privacy at the query	Masking is applied in the data layer, not the template, so a requirement cannot leak a name or number through any read path.
Approval as state	Requirements, instructor profiles and store listings share one approval status that governs public visibility and indexing together.

FOUND THE WAY PARENTS SEARCH

Tuition demand is local and specific: a class, a subject, a neighbourhood. The site's taxonomy is also its sitemap, so those queries land on a page that already holds the answer.

CLASS & SUBJECT PAGES

Every class from Nursery to 12 and every core subject resolves to an indexable page with live packages and material.

LOCAL INTENT

Home-tuition demand is captured by city and area, which is how parents phrase the search.

PRODUCT PAGES

Each store title and test series carries its own URL, price and description rather than sitting behind a filter.

EDITORIAL & JOBS

A blog and a teaching-jobs section build depth on both sides of the marketplace.

OUTCOME

TutorWale sells online across all four lines. A student buys a test series by duration and starts attempting papers immediately; a parent orders notes for a specific class; a family posts a tuition requirement and hears from verified teachers; the TutorWale team runs catalogue, pricing, approvals and lead distribution from one admin. The shared taxonomy means new classes, subjects, cities and product lines are configuration rather than a rebuild.
